# **vistir Documentation**

*Release 0.5.3.dev0*

**Dan Ryan <dan@danryan.co>**

**May 20, 2020**

<b>1</b>	<b>vistir: Setup / utilities which most projects eventually need</b>	<b>1</b>
1.1	Installation . . . . .	1
1.2	Summary . . . . .	1
1.3	Usage . . . . .	2
1.3.1	Importing a utility . . . . .	2
1.4	Functionality . . . . .	2
1.4.1	Compatibility Shims . . . . .	2
1.4.2	Context Managers . . . . .	3
1.4.2.1	<b>atomic_open_for_write</b> . . . . .	3
1.4.2.2	<b>cd</b> . . . . .	3
1.4.2.3	<b>open_file</b> . . . . .	4
1.4.2.4	<b>replaced_stream</b> . . . . .	4
1.4.2.5	<b>replaced_streams</b> . . . . .	4
1.4.2.6	<b>spinner</b> . . . . .	4
1.4.2.7	<b>temp_environ</b> . . . . .	5
1.4.2.8	<b>temp_path</b> . . . . .	5
1.4.3	Miscellaneous Utilities . . . . .	5
1.4.3.1	<b>shell_escape</b> . . . . .	6
1.4.3.2	<b>unnest</b> . . . . .	6
1.4.3.3	<b>dedup</b> . . . . .	6
1.4.3.4	<b>run</b> . . . . .	7
1.4.3.5	<b>load_path</b> . . . . .	7
1.4.3.6	<b>partialclass</b> . . . . .	7
1.4.3.7	<b>to_text</b> . . . . .	7
1.4.3.8	<b>to_bytes</b> . . . . .	7
1.4.3.9	<b>chunked</b> . . . . .	8
1.4.3.10	<b>take</b> . . . . .	8
1.4.3.11	<b>divide</b> . . . . .	8

---

vistir: Setup / utilities which most projects eventually need

---

## 1.1 Installation

Install from PyPI:

```
$ pipenv install vistir
```

Install from Github:

```
$ pipenv install -e git+https://github.com/sarugaku/vistir.git#egg=vistir
```

## 1.2 Summary

**vistir** is a library full of utility functions designed to make life easier. Here are some of the places where these functions are used:

- pipenv
- requirementslib
- pip-tools
- passa

- `pythonfinder`

## 1.3 Usage

### 1.3.1 Importing a utility

You can import utilities directly from **vistir**:

```
from vistir import cd
cd('/path/to/somedir'):
    do_stuff_in('somedir')
```

## 1.4 Functionality

**vistir** provides several categories of functionality, including:

- Backports
- Compatibility Shims
- Context Managers
- Miscellaneous Utilities
- Path Utilities

---

**Note:** The backports should be imported via `compat` which will provide the native versions of the backported items if possible.

---

### 1.4.1 Compatibility Shims

Shims are provided for full API compatibility from python 2.7 through 3.7 for the following:

- `weakref.finalize()`
- `functools.partialmethod()` (via `partialmethod()`)
- `tempfile.TemporaryDirectory` (via `TemporaryDirectory`)
- `tempfile.NamedTemporaryFile` (via `NamedTemporaryFile`)
- `Path`
- `get_terminal_size()`
- `JSONDecodeError`
- `ResourceWarning`
- `FileNotFoundError`
- `PermissionError`
- `IsADirectoryError`

The following additional function is provided for encoding strings to the filesystem default encoding:

- `fs_str()`
- `to_native_string()`
- `fs_encode()`
- `vistir.compat.fs_decode()`

## 1.4.2 Context Managers

**vistir** provides the following context managers as utility contexts:

- `atomic_open_for_write()`
- `cd()`
- `open_file()`
- `replaced_stream()`
- `replaced_streams()`
- `spinner()`
- `temp_environ()`
- `temp_path()`

### 1.4.2.1 atomic\_open\_for\_write

This context manager ensures that a file only gets overwritten if the contents can be successfully written in its place. If you open a file for writing and then fail in the middle under normal circumstances, your original file is already gone.

```
>>> fn = "test_file.txt"
>>> with open(fn, "w") as fh:
    fh.write("this is some test text")
>>> read_test_file()
this is some test text
>>> def raise_exception_while_writing(filename):
    with vistir.contextmanagers.atomic_open_for_write(filename) as fh:
        fh.write("Overwriting all the text from before with even newer text")
        raise RuntimeError("But did it get overwritten now?")
>>> raise_exception_while_writing(fn)
Traceback (most recent call last):
    ...
RuntimeError: But did it get overwritten now?
>>> read_test_file()
writing some new text
```

### 1.4.2.2 cd

A context manager for temporarily changing the working directory.

```
>>> os.path.abspath(os.curdir)
'/tmp/test'
>>> with vistir.contextmanagers.cd('/tmp/vistir_test'):
    print(os.path.abspath(os.curdir))
/tmp/vistir_test
```

### 1.4.2.3 open\_file

A context manager for streaming file contents, either local or remote. It is recommended to pair this with an iterator which employs a sensible chunk size.

```
>>> filecontents = b""
    with vistir.contextmanagers.open_file("https://norvig.com/big.txt") as fp:
        for chunk in iter(lambda: fp.read(16384), b""):
            filecontents.append(chunk)
>>> import io
>>> import shutil
>>> filecontents = io.BytesIO(b"")
>>> with vistir.contextmanagers.open_file("https://norvig.com/big.txt") as fp:
    shutil.copyfileobj(fp, filecontents)
```

### 1.4.2.4 replaced\_stream

A context manager to temporarily swap out *stream\_name* with a stream wrapper. This will capture the stream output and prevent it from being written as normal.

```
>>> orig_stdout = sys.stdout
>>> with replaced_stream("stdout") as stdout:
...     sys.stdout.write("hello")
...     assert stdout.getvalue() == "hello"

>>> sys.stdout.write("hello")
'hello'
```

### 1.4.2.5 replaced\_streams

Temporarily replaces both *sys.stdout* and *sys.stderr* and captures anything written to these respective targets.

```
>>> import sys
>>> with vistir.contextmanagers.replaced_streams() as streams:
>>>     stdout, stderr = streams
>>>     sys.stderr.write("test")
>>>     sys.stdout.write("hello")
>>>     assert stdout.getvalue() == "hello"
>>>     assert stderr.getvalue() == "test"

>>> stdout.getvalue()
'hello'

>>> stderr.getvalue()
'test'
```

### 1.4.2.6 spinner

A context manager for wrapping some actions with a threaded, interrupt-safe spinner. The spinner is fully compatible with all terminals (you can use `bouncingBar` on non-utf8 terminals) and will allow you to update the text of the spinner itself by simply setting `spinner.text` or write lines to the screen above the spinner by using `spinner.write(line)`. Success text can be indicated using `spinner.ok("Text")` and failure text can be indicated with `spinner.fail("Fail text")`.

```
>>> lines = ["a", "b"]
>>> with vistir.contextmanagers.spinner(spinner_name="dots", text="Running..."):
↳ handler_map={}, nospin=False) as sp:
    for line in lines:
        sp.write(line + "\n")
        while some_variable = some_queue.pop():
            sp.text = "Consuming item: %s" % some_variable
        if success_condition:
            sp.ok("Succeeded!")
        else:
            sp.fail("Failed!")
```

### 1.4.2.7 temp\_environ

Sets a temporary environment context to freely manipulate `os.environ` which will be reset upon exiting the context.

```
>>> os.environ['MY_KEY'] = "test"
>>> os.environ['MY_KEY']
'test'
>>> with vistir.contextmanagers.temp_environ():
    os.environ['MY_KEY'] = "another thing"
    print("New key: %s" % os.environ['MY_KEY'])
New key: another thing
>>> os.environ['MY_KEY']
'test'
```

### 1.4.2.8 temp\_path

Sets a temporary environment context to freely manipulate `sys.path` which will be reset upon exiting the context.

```
>>> path_from_virtualenv = load_path("/path/to/venv/bin/python")
>>> print(sys.path)
['/home/user/.pyenv/versions/3.7.0/bin', '/home/user/.pyenv/versions/3.7.0/lib/
↳ python37.zip', '/home/user/.pyenv/versions/3.7.0/lib/python3.7', '/home/user/.pyenv/
↳ versions/3.7.0/lib/python3.7/lib-dynload', '/home/user/.pyenv/versions/3.7.0/lib/
↳ python3.7/site-packages']
>>> with temp_path():
    sys.path = path_from_virtualenv
    # Running in the context of the path above
    run(["pip", "install", "stuff"])
>>> print(sys.path)
['/home/user/.pyenv/versions/3.7.0/bin', '/home/user/.pyenv/versions/3.7.0/lib/
↳ python37.zip', '/home/user/.pyenv/versions/3.7.0/lib/python3.7', '/home/user/.pyenv/
↳ versions/3.7.0/lib/python3.7/lib-dynload', '/home/user/.pyenv/versions/3.7.0/lib/
↳ python3.7/site-packages']
```

## 1.4.3 Miscellaneous Utilities

The following Miscellaneous utilities are available as helper methods:

- `shell_escape()`
- `unnest()`

- `dedup()`
- `run()`
- `load_path()`
- `partialclass()`
- `to_text()`
- `to_bytes()`
- `divide()`
- `take()`
- `chunked()`
- `decode_for_output()`
- `get_canonical_encoding_name()`
- `get_wrapped_stream()`
- `StreamWrapper`
- `get_text_stream()`
- `replace_with_text_stream()`
- `get_text_stdin()`
- `get_text_stdout()`
- `get_text_stderr()`
- `echo()`

### 1.4.3.1 shell\_escape

Escapes a string for use as shell input when passing `shell=True` to `os.Popen()`.

```
>>> vistir.misc.shell_escape("/tmp/test/test script.py hello")
'/tmp/test/test script.py hello'
```

### 1.4.3.2 unnest

Unnests nested iterables into a flattened one.

```
>>> nested_iterable = (1234, (3456, 4398345, (234234)), (2396, (23895750, 9283798,
↳ 29384, (289375983275, 293759, 2347, (2098, 7987, 27599))))
>>> list(vistir.misc.unnest(nested_iterable))
[1234, 3456, 4398345, 234234, 2396, 23895750, 9283798, 29384, 289375983275, 293759,
↳ 2347, 2098, 7987, 27599]
```

### 1.4.3.3 dedup

Deduplicates an iterable (like a `set`, but preserving order).

```
>>> iterable = ["repeatedval", "uniqueval", "repeatedval", "anotherval",
↳ "somethingelse"]
>>> list(vistir.misc.dedup(iterable))
['repeatedval', 'uniqueval', 'anotherval', 'somethingelse']
```

#### 1.4.3.4 run

Runs the given command using `subprocess.Popen()` and passing sane defaults.

```
>>> out, err = vistir.run(["cat", "/proc/version"])
>>> out
'Linux version 4.15.0-27-generic (buildd@lgw01-amd64-044) (gcc version 7.3.0 (Ubuntu_
↳ 7.3.0-16ubuntu3)) #29-Ubuntu SMP Wed Jul 11 08:21:57 UTC 2018'
```

#### 1.4.3.5 load\_path

Load the `sys.path` from the given python executable's environment as json.

```
>>> load_path("/home/user/.virtualenvs/requirementslib-5MhGuG3C/bin/python")
['', '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python3.7.zip', '/home/user/
↳ .virtualenvs/requirementslib-5MhGuG3C/lib/python3.7', '/home/user/.virtualenvs/
↳ requirementslib-5MhGuG3C/lib/python3.7/lib-dynload', '/home/user/.pyenv/versions/3.
↳ 7.0/lib/python3.7', '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python3.7/
↳ site-packages', '/home/user/git/requirementslib/src']
```

#### 1.4.3.6 partialclass

Create a partially instantiated class.

```
>>> source = partialclass(Source, url="https://pypi.org/simple")
>>> new_source = source(name="pypi")
>>> new_source
<__main__.Source object at 0x7f23af189b38>
>>> new_source.__dict__
{'url': 'https://pypi.org/simple', 'verify_ssl': True, 'name': 'pypi'}
```

#### 1.4.3.7 to\_text

Convert arbitrary text-formattable input to text while handling errors.

```
>>> vistir.misc.to_text(b"these are bytes")
'these are bytes'
```

#### 1.4.3.8 to\_bytes

Converts arbitrary byte-convertable input to bytes while handling errors.

```
>>> vistir.misc.to_bytes("this is some text")
b'this is some text'
>>> vistir.misc.to_bytes(u"this is some text")
b'this is some text'
```

#### 1.4.3.9 chunked

Splits an iterable up into groups *of the specified length*, per [more itertools](#). Returns an iterable.

This example will create groups of chunk size **5**, which means there will be *6 groups*.

```
>>> chunked_iterable = vistir.misc.chunked(5, range(30))
>>> for chunk in chunked_iterable:
...     add_to_some_queue(chunk)
```

#### 1.4.3.10 take

Take elements from the supplied iterable without consuming it.

```
>>> iterable = range(30)
>>> first_10 = take(10, iterable)
>>> [i for i in first_10]
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]

>>> [i for i in iterable]
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23,
 ↪ 24, 25, 26, 27, 28, 29]
```

#### 1.4.3.11 divide

Splits an iterable up into the *specified number of groups*, per [more itertools](#). Returns an iterable.

```
>>> iterable = range(30)
>>> groups = []
>>> for grp in vistir.misc.divide(3, iterable):
...     groups.append(grp)
>>> groups
[<tuple_iterator object at 0x7fb7966006a0>, <tuple_iterator object at 0x7fb796652780>,
 ↪ <tuple_iterator object at 0x7fb79650a2b0>]
```

#### 1.4.3.12 decode\_for\_output

Converts an arbitrary text input to output which is encoded for printing to terminal outputs using the system preferred locale using `locale.getpreferredencoding(False)` with some additional hackery on linux systems.

```
>>> vistir.misc.decode_for_output(u"Some text")
"some default locale encoded text"
```

### 1.4.3.13 get\_canonical\_encoding\_name

Given an encoding name, get the canonical name from a codec lookup.

```
>>> vistir.misc.get_canonical_encoding_name("utf8")
"utf-8"
```

### 1.4.3.14 get\_wrapped\_stream

Given a stream, wrap it in a *StreamWrapper* instance and return the wrapped stream.

```
>>> stream = sys.stdout
>>> wrapped_stream = vistir.misc.get_wrapped_stream(sys.stdout)
```

### 1.4.3.15 StreamWrapper

A stream wrapper and compatibility class for handling wrapping file-like stream objects which may be used in place of `sys.stdout` and other streams.

```
>>> wrapped_stream = vistir.misc.StreamWrapper(sys.stdout, encoding="utf-8", errors=
↳ "replace", line_buffering=True)
>>> wrapped_stream = vistir.misc.StreamWrapper(io.StringIO(), encoding="utf-8",
↳ errors="replace", line_buffering=True)
```

### 1.4.3.16 get\_text\_stream

An implementation of the **StreamWrapper** for the purpose of wrapping `sys.stdin` or `sys.stdout`.

On Windows, this returns the appropriate handle to the requested output stream.

```
>>> text_stream = vistir.misc.get_text_stream("stdout")
>>> sys.stdout = text_stream
>>> sys.stdin = vistir.misc.get_text_stream("stdin")
>>> vistir.misc.echo(u"\0499", fg="green")
```

### 1.4.3.17 replace\_with\_text\_stream

Given a text stream name, replaces the text stream with a **StreamWrapper** instance.

```
>>> vistir.misc.replace_with_text_stream("stdout")
```

Once invoked, the standard stream in question is replaced with the required wrapper, turning it into a `TextIOWrapper` compatible stream (which ensures that unicode characters can be written to it).

### 1.4.3.18 get\_text\_stdin

A helper function for calling `get_text_stream("stdin")`.

### 1.4.3.19 `get_text_stdout`

A helper function for calling `get_text_stream("stdout")`.

### 1.4.3.20 `get_text_stderr`

A helper function for calling `get_text_stream("stderr")`.

### 1.4.3.21 `echo`

Writes colored, stream-compatible output to the desired handle (`sys.stdout` by default).

```
>>> vistir.misc.echo("some text", fg="green", bg="black", style="bold", err=True) #_
↪write to stderr
some text
>>> vistir.misc.echo("some other text", fg="cyan", bg="white", style="underline") #_
↪write to stdout
some other text
```

## 1.4.4 Path Utilities

**vistir** provides utilities for interacting with filesystem paths:

- `vistir.path.normalize_path()`
- `vistir.path.is_in_path()`
- `vistir.path.get_converted_relative_path()`
- `vistir.path.handle_remove_readonly()`
- `vistir.path.is_file_url()`
- `vistir.path.is_readonly_path()`
- `vistir.path.is_valid_url()`
- `vistir.path.mkdir_p()`
- `vistir.path.ensure_mkdir_p()`
- `vistir.path.create_tracked_tempdir()`
- `vistir.path.create_tracked_tempfile()`
- `vistir.path.path_to_url()`
- `vistir.path.rmtree()`
- `vistir.path.safe_expandvars()`
- `vistir.path.set_write_bit()`
- `vistir.path.url_to_path()`
- `vistir.path.walk_up()`

#### 1.4.4.1 normalize\_path

Return a case-normalized absolute variable-expanded path.

```
>>> vistir.path.normalize_path("~/${USER}")
/home/user/user
```

#### 1.4.4.2 is\_in\_path

Determine if the provided full path is in the given parent root.

```
>>> vistir.path.is_in_path("~/pyenv/versions/3.7.1/bin/python", "${PYENV_ROOT}/
↳versions")
True
```

#### 1.4.4.3 get\_converted\_relative\_path

Convert the supplied path to a relative path (relative to `os.getcwd()`)

```
>>> os.chdir('/home/user/code/myrepo/myfolder')
>>> vistir.path.get_converted_relative_path('/home/user/code/file.zip')
'../../file.zip'
>>> vistir.path.get_converted_relative_path('/home/user/code/myrepo/myfolder/
↳mysubfolder')
'./mysubfolder'
>>> vistir.path.get_converted_relative_path('/home/user/code/myrepo/myfolder')
'.'
```

#### 1.4.4.4 handle\_remove\_readonly

Error handler for `shutil.rmtree()`.

Windows source repo folders are read-only by default, so this error handler attempts to set them as writeable and then proceed with deletion.

This function will call `check_vistir.path.is_readonly_path()` before attempting to call `vistir.path.set_write_bit()` on the target path and try again.

#### 1.4.4.5 is\_file\_url

Checks whether the given url is a properly formatted `file:// uri`.

```
>>> vistir.path.is_file_url('file:///home/user/somefile.zip')
True
>>> vistir.path.is_file_url('/home/user/somefile.zip')
False
```

#### 1.4.4.6 is\_readonly\_path

Check if a provided path exists and is read-only by checking for `bool(path.stat & stat.S_IREAD)` and not `os.access(path, os.W_OK)`

```
>>> vistir.path.is_readonly_path('/etc/passwd')
True
>>> vistir.path.is_readonly_path('/home/user/.bashrc')
False
```

#### 1.4.4.7 is\_valid\_url

Checks whether a URL is valid and parseable by checking for the presence of a scheme and a netloc.

```
>>> vistir.path.is_valid_url("https://google.com")
True
>>> vistir.path.is_valid_url("/home/user/somefile")
False
```

#### 1.4.4.8 mkdir\_p

Recursively creates the target directory and all of its parents if they do not already exist. Fails silently if they do.

```
>>> os.mkdir('/tmp/test_dir')
>>> os.listdir('/tmp/test_dir')
[]
>>> vistir.path.mkdir_p('/tmp/test_dir/child/subchild/subsubchild')
>>> os.listdir('/tmp/test_dir/child/subchild')
['subsubchild']
```

#### 1.4.4.9 ensure\_mkdir\_p

A decorator which ensures that the caller function's return value is created as a directory on the filesystem.

```
>>> @ensure_mkdir_p
def return_fake_value(path):
    return path
>>> return_fake_value('/tmp/test_dir')
>>> os.listdir('/tmp/test_dir')
[]
>>> return_fake_value('/tmp/test_dir/child/subchild/subsubchild')
>>> os.listdir('/tmp/test_dir/child/subchild')
['subsubchild']
```

#### 1.4.4.10 create\_tracked\_tempdir

Creates a tracked temporary directory using TemporaryDirectory, but does not remove the directory when the return value goes out of scope, instead registers a handler to cleanup on program exit.

```
>>> temp_dir = vistir.path.create_tracked_tempdir(prefix="test_dir")
>>> assert temp_dir.startswith("test_dir")
True
>>> with vistir.path.create_tracked_tempdir(prefix="test_dir") as temp_dir:
    with io.open(os.path.join(temp_dir, "test_file.txt"), "w") as fh:
        fh.write("this is a test")
>>> os.listdir(temp_dir)
```

#### 1.4.4.11 create\_tracked\_tempfile

Creates a tracked temporary file using `vistir.compat.NamedTemporaryFile`, but creates a `weakref.finalize` call which will detach on garbage collection to close and delete the file.

```
>>> temp_file = vistir.path.create_tracked_tempfile(prefix="requirements", suffix="txt
↳")
>>> temp_file.write("some\nstuff")
>>> exit()
```

#### 1.4.4.12 path\_to\_url

Convert the supplied local path to a file uri.

```
>>> path_to_url("/home/user/code/myrepo/myfile.zip")
'file:///home/user/code/myrepo/myfile.zip'
```

#### 1.4.4.13 rmtree

Stand-in for `rmtree()` with additional error-handling.

This version of `rmtree` handles read-only paths, especially in the case of index files written by certain source control systems.

```
>>> vistir.path.rmtree('/tmp/test_dir')
>>> [d for d in os.listdir('/tmp') if 'test_dir' in d]
[]
```

**Note:** Setting `ignore_errors=True` may cause this to silently fail to delete the path

#### 1.4.4.14 safe\_expandvars

Call `os.path.expandvars()` if value is a string, otherwise do nothing.

```
>>> os.environ['TEST_VAR'] = "MY_TEST_VALUE"
>>> vistir.path.safe_expandvars("https://myuser:${TEST_VAR}@myfakewebsite.com")
'https://myuser:MY_TEST_VALUE@myfakewebsite.com'
```

#### 1.4.4.15 set\_write\_bit

Set read-write permissions for the current user on the target path. Fail silently if the path doesn't exist.

```
>>> vistir.path.set_write_bit('/path/to/some/file')
>>> with open('/path/to/some/file', 'w') as fh:
    fh.write("test text!")
```

#### 1.4.4.16 url\_to\_path

Convert a valid file url to a local filesystem path. Follows logic taken from pip.

```
>>> vistir.path.url_to_path("file:///home/user/somefile.zip")
'/home/user/somefile.zip'
```

`vistir.shell_escape(cmd)`

Escape strings for use in `Popen()` and `run()`.

This is a passthrough method for instantiating a `Script` object which can be used to escape commands to output as a single string.

`vistir.load_path(python)`

Load the `sys.path` from the given python executable's environment as json.

**Parameters** `python` (*str*) – Path to a valid python executable

**Returns** A python representation of the `sys.path` value of the given python executable.

**Return type** `list`

```
>>> load_path("/home/user/.virtualenvs/requirementslib-5MhGuG3C/bin/python")
['', '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python37.zip',
 '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python3.7',
 '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python3.7/lib-dynload',
 '/home/user/.pyenv/versions/3.7.0/lib/python3.7',
 '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python3.7/site-packages',
 '/home/user/git/requirementslib/src']
```

`vistir.run(cmd, env=None, return_object=False, block=True, cwd=None, verbose=False, nospin=False, spinner_name=None, combine_stderr=True, display_limit=200, write_to_stdout=True)`

Use `subprocess.Popen` to get the output of a command and decode it.

**Parameters**

- **cmd** (*list*) – A list representing the command you want to run.
- **env** (*dict*) – Additional environment settings to pass through to the subprocess.
- **return\_object** (*bool*) – When True, returns the whole subprocess instance
- **block** (*bool*) – When False, returns a potentially still-running `subprocess.Popen` instance
- **cwd** (*str*) – Current working directory context to use for spawning the subprocess.

- **verbose** (*bool*) – Whether to print stdout in real time when non-blocking.
- **nospin** (*bool*) – Whether to disable the cli spinner.
- **spinner\_name** (*str*) – The name of the spinner to use if enabled, defaults to bouncing-Bar
- **combine\_stderr** (*bool*) – Optionally merge stdout and stderr in the subprocess, false if nonblocking.
- **dispay\_limit** (*int*) – The max width of output lines to display when using a spinner.
- **write\_to\_stdout** (*bool*) – Whether to write to stdout when using a spinner, defaults to True.

**Returns** A 2-tuple of (output, error) or a `subprocess.Popen` object.

**Warning:** Merging standard out and standarad error in a nonblocking subprocess can cause errors in some cases and may not be ideal. Consider disabling this functionality.

`vistir.partialclass` (*cls, \*args, \*\*kwargs*)

Returns a partially instantiated class.

**Returns** A partial class instance

**Return type** `cls`

```
>>> source = partialclass(Source, url="https://pypi.org/simple")
>>> source
<class '__main__.Source'>
>>> source(name="pypi")
>>> source.__dict__
mappingproxy({
  '__module__': '__main__',
  '__dict__': <attribute '__dict__' of 'Source' objects>,
  '__weakref__': <attribute '__weakref__' of 'Source' objects>,
  '__doc__': None,
  '__init__': functools.partialmethod(
    <function Source.__init__ at 0x7f23af429bf8>, , url='https://pypi.org/
↪simple'
  )
})
>>> new_source = source(name="pypi")
>>> new_source
<__main__.Source object at 0x7f23af189b38>
>>> new_source.__dict__
{'url': 'https://pypi.org/simple', 'verify_ssl': True, 'name': 'pypi'}
```

`vistir.temp_environ` ()

Allow the ability to set `os.environ` temporarily

`vistir.temp_path` ()

A context manager which allows the ability to set `sys.path` temporarily

```
>>> path_from_virtualenv = load_path("/path/to/venv/bin/python")
>>> print(sys.path)
[
  '/home/user/.pyenv/versions/3.7.0/bin',
  '/home/user/.pyenv/versions/3.7.0/lib/python37.zip',
```

(continues on next page)

(continued from previous page)

```

'/home/user/.pyenv/versions/3.7.0/lib/python3.7',
'/home/user/.pyenv/versions/3.7.0/lib/python3.7/lib-dynload',
'/home/user/.pyenv/versions/3.7.0/lib/python3.7/site-packages'
]
>>> with temp_path():
    sys.path = path_from_virtualenv
    # Running in the context of the path above
    run(["pip", "install", "stuff"])
>>> print(sys.path)
[
'/home/user/.pyenv/versions/3.7.0/bin',
'/home/user/.pyenv/versions/3.7.0/lib/python37.zip',
'/home/user/.pyenv/versions/3.7.0/lib/python3.7',
'/home/user/.pyenv/versions/3.7.0/lib/python3.7/lib-dynload',
'/home/user/.pyenv/versions/3.7.0/lib/python3.7/site-packages'
]

```

**vistir.cd** (*path*)

Context manager to temporarily change working directories

**Parameters** *path* (*str*) – The directory to move into

```

>>> print(os.path.abspath(os.curdir))
'/home/user/code/myrepo'
>>> with cd("/home/user/code/otherdir/subdir"):
...     print("Changed directory: %s" % os.path.abspath(os.curdir))
Changed directory: /home/user/code/otherdir/subdir
>>> print(os.path.abspath(os.curdir))
'/home/user/code/myrepo'

```

**vistir.atomic\_open\_for\_write** (*target*, *binary=False*, *newline=None*, *encoding=None*)Atomically open *target* for writing.

This is based on Lektor's *atomic\_open()* utility, but simplified a lot to handle only writing, and skip many multi-process/thread edge cases handled by Werkzeug.

**Parameters**

- **target** (*str*) – Target filename to write
- **binary** (*bool*) – Whether to open in binary mode, default False
- **newline** (*Optional[str]*) – The newline character to use when writing, determined from system if not supplied.
- **encoding** (*Optional[str]*) – The encoding to use when writing, defaults to system encoding.

How this works:

- Create a temp file (in the same directory of the actual target), and yield for surrounding code to write to it.
- If some thing goes wrong, try to remove the temp file. The actual target is not touched whatsoever.
- If everything goes well, close the temp file, and replace the actual target with this new file.

```

>>> fn = "test_file.txt"
>>> def read_test_file(filename=fn):
    with open(filename, 'r') as fh:
        print(fh.read().strip())

```

(continues on next page)

(continued from previous page)

```

>>> with open(fn, "w") as fh:
    fh.write("this is some test text")
>>> read_test_file()
this is some test text

>>> def raise_exception_while_writing(filename):
    with open(filename, "w") as fh:
        fh.write("writing some new text")
        raise RuntimeError("Uh oh, hope your file didn't get overwritten")

>>> raise_exception_while_writing(fn)
Traceback (most recent call last):
...
RuntimeError: Uh oh, hope your file didn't get overwritten
>>> read_test_file()
writing some new text

# Now try with vistir
>>> def raise_exception_while_writing(filename):
    with vistir.contextmanagers.atomic_open_for_write(filename) as fh:
        fh.write("Overwriting all the text from before with even newer text")
        raise RuntimeError("But did it get overwritten now?")

>>> raise_exception_while_writing(fn)
Traceback (most recent call last):
...
RuntimeError: But did it get overwritten now?

>>> read_test_file()
writing some new text

```

`vistir.open_file` (*link*, *session=None*, *stream=True*)

Open local or remote file for reading.

#### Parameters

- **link** (*pip.\_internal.index.Link*) – A link object from resolving dependencies with pip, or else a URL.
- **session** (*Optional[Session]*) – A Session instance
- **stream** (*bool*) – Whether to stream the content if remote, default True

**Raises** `ValueError` – If link points to a local directory.

**Returns** a context manager to the opened file-like object

`vistir.rmtree` (*directory*, *ignore\_errors=False*, *onerror=None*)

Stand-in for `rmtree()` with additional error-handling.

This version of `rmtree` handles read-only paths, especially in the case of index files written by certain source control systems.

#### Parameters

- **directory** (*str*) – The target directory to remove
- **ignore\_errors** (*bool*) – Whether to ignore errors, defaults to False

- **onerror** (*func*) – An error handling function, defaults to `handle_remove_readonly()`

---

**Note:** Setting `ignore_errors=True` may cause this to silently fail to delete the path

---

`vistir.mkdir_p(newdir, mode=511)`

Recursively creates the target directory and all of its parents if they do not already exist. Fails silently if they do.

**Parameters** `newdir` (*str*) – The directory path to ensure

**Raises** `OSError` if a file is encountered along the way

**class** `vistir.TemporaryDirectory(suffix="", prefix=None, dir=None)`

Bases: `object`

Create and return a temporary directory. This has the same behavior as `mkdtemp` but can be used as a context manager. For example:

**with** `TemporaryDirectory()` as `tmpdir`: ...

Upon exiting the context, the directory and everything contained in it are removed.

**cleanup** ()

`vistir.NamedTemporaryFile(mode='w+b', buffering=-1, encoding=None, newline=None, suffix=None, prefix=None, dir=None, delete=True)`

Create and return a temporary file. Arguments: ‘prefix’, ‘suffix’, ‘dir’ – as for `mkstemp`. ‘mode’ – the mode argument to `io.open` (default “w+b”). ‘buffering’ – the buffer size argument to `io.open` (default -1). ‘encoding’ – the encoding argument to `io.open` (default None) ‘newline’ – the newline argument to `io.open` (default None) ‘delete’ – whether the file is deleted on close (default True). The file is created as `mkstemp()` would do it.

Returns an object with a file-like interface; the name of the file is accessible as its ‘name’ attribute. The file will be automatically deleted when it is closed unless the ‘delete’ argument is set to False.

**class** `vistir.partialmethod(func, *args, **keywords)`

Bases: `object`

Method descriptor with partial application of the given arguments and keywords.

Supports wrapping existing descriptors and handles non-descriptor callables as instance methods.

`vistir.spinner(spinner_name=None, start_text=None, handler_map=None, nospin=False, write_to_stdout=True)`

Get a spinner object or a dummy spinner to wrap a context.

#### Parameters

- **spinner\_name** (*str*) – A spinner type e.g. “dots” or “bouncingBar” (default: {“bouncingBar”})
- **start\_text** (*str*) – Text to start off the spinner with (default: {None})
- **handler\_map** (*dict*) – Handler map for signals to be handled gracefully (default: {None})
- **nospin** (*bool*) – If true, use the dummy spinner (default: {False})
- **write\_to\_stdout** (*bool*) – Writes to stdout if true, otherwise writes to stderr (default: True)

**Returns** A spinner object which can be manipulated while alive

**Return type** `VistirSpinner`

**Raises:** `RuntimeError` – Raised if the spinner extra is not installed

`vistir.create_spinner(*args, **kwargs)`

`vistir.create_tracked_tempdir(*args, **kwargs)`

Create a tracked temporary directory.

This uses `TemporaryDirectory`, but does not remove the directory when the return value goes out of scope, instead registers a handler to cleanup on program exit.

The return value is the path to the created directory.

`vistir.create_tracked_tempfile(*args, **kwargs)`

Create a tracked temporary file.

This uses the `NamedTemporaryFile` construct, but does not remove the file until the interpreter exits.

The return value is the file object.

`vistir.to_native_string(string)`

`vistir.decode_for_output(output, target_stream=None, translation_map=None)`

Given a string, decode it for output to a terminal.

#### Parameters

- **output** (*str*) – A string to print to a terminal
- **target\_stream** – A stream to write to, we will encode to target this stream if possible.
- **translation\_map** (*dict*) – A mapping of unicode character ordinals to replacement strings.

**Returns** A re-encoded string using the preferred encoding

**Return type** `str`

`vistir.to_text(string, encoding='utf-8', errors=None)`

Force a value to a text-type.

#### Parameters

- **string** (*str* or *bytes* or *unicode*) – Some input that can be converted to a unicode representation.
- **encoding** – The encoding to use for conversions, defaults to “utf-8”
- **encoding** – str, optional

**Returns** The unicode representation of the string

**Return type** `str`

`vistir.to_bytes(string, encoding='utf-8', errors=None)`

Force a value to bytes.

#### Parameters

- **string** (*str* or *bytes* or *unicode* or a *memoryview subclass*) – Some input that can be converted to a bytes.
- **encoding** – The encoding to use for conversions, defaults to “utf-8”
- **encoding** – str, optional

**Returns** Corresponding byte representation (for use in filesystem operations)

**Return type** `bytes`

`vistir.take(n, iterable)`

Take *n* elements from the supplied iterable without consuming it.

**Parameters**

- **n** (*int*) – Number of unique groups
- **iterable** (*iter*) – An iterable to split up

from [https://github.com/erikrose/more-itertools/blob/master/more\\_itertools/recipes.py](https://github.com/erikrose/more-itertools/blob/master/more_itertools/recipes.py)

`vistir.chunked(n, iterable)`

Split an iterable into lists of length *n*.

**Parameters**

- **n** (*int*) – Number of unique groups
- **iterable** (*iter*) – An iterable to split up

from [https://github.com/erikrose/more-itertools/blob/master/more\\_itertools/more.py](https://github.com/erikrose/more-itertools/blob/master/more_itertools/more.py)

`vistir.divide(n, iterable)`

split an iterable into *n* groups, per <https://more-itertools.readthedocs.io/en/latest/api.html#grouping>.

**Parameters**

- **n** (*int*) – Number of unique groups
- **iterable** (*iter*) – An iterable to split up

**Returns** a list of new iterables derived from the original iterable

**Return type** `list`

**class** `vistir.StringIO`

Bases: `_io._TextIOBase`

Text I/O implementation using an in-memory buffer.

The `initial_value` argument sets the value of object. The `newline` argument is like the one of `TextIOWrapper`'s constructor.

**close()**

Close the IO object.

Attempting any further operation after the object is closed will raise a `ValueError`.

This method has no effect if the file is already closed.

**closed**

**getvalue()**

Retrieve the entire contents of the object.

**line\_buffering**

**newlines**

Line endings translated so far.

Only line endings translated during reading are considered.

Subclasses should override.

**read()**

Read at most *size* characters, returned as a string.

If the argument is negative or omitted, read until EOF is reached. Return an empty string at EOF.

**readable ()**

Returns True if the IO object can be read.

**readline ()**

Read until newline or EOF.

Returns an empty string if EOF is hit immediately.

**seek ()**

Change stream position.

**Seek to character offset pos relative to position indicated by whence:** 0 Start of stream (the default). pos should be  $\geq 0$ ; 1 Current position - pos must be 0; 2 End of stream - pos must be 0.

Returns the new absolute position.

**seekable ()**

Returns True if the IO object can be seeked.

**tell ()**

Tell the current file position.

**truncate ()**

Truncate size to pos.

The pos argument defaults to the current file position, as returned by tell(). The current file position is unchanged. Returns the new absolute position.

**writable ()**

Returns True if the IO object can be written.

**write ()**

Write string to file.

Returns the number of characters written, which is always equal to the length of the string.

`vistir.get_wrapped_stream (stream, encoding=None, errors='replace')`

Given a stream, wrap it in a *StreamWrapper* instance and return the wrapped stream.

**Parameters**

- **stream** – A stream instance to wrap
- **encoding** (*str*) – The encoding to use for the stream
- **errors** (*str*) – The error handler to use, default “replace”

**Returns** A new, wrapped stream

**Return type** *StreamWrapper*

**class** `vistir.StreamWrapper (stream, encoding, errors, line_buffering=True, **kwargs)`

Bases: `_io.TextIOWrapper`

This wrapper class will wrap a provided stream and supply an interface for compatibility.

**isatty ()**

Return whether this is an ‘interactive’ stream.

Return False if it can’t be determined.

**write (x)**

Write string to stream. Returns the number of characters written (which is always equal to the length of the string).

**writelines (lines)**

`vistir.replaced_stream(stream_name)`

Context manager to temporarily swap out `stream_name` with a stream wrapper.

**Parameters** `stream_name` (*str*) – The name of a sys stream to wrap

**Returns** A StreamWrapper replacement, temporarily

```
>>> orig_stdout = sys.stdout
>>> with replaced_stream("stdout") as stdout:
...     sys.stdout.write("hello")
...     assert stdout.getvalue() == "hello"
```

```
>>> sys.stdout.write("hello")
'hello'
```

`vistir.replaced_streams()`

Context manager to replace both `sys.stdout` and `sys.stderr` using `replaced_stream`

returns: (*stdout, stderr*)

```
>>> import sys
>>> with vistir.contextmanagers.replaced_streams() as streams:
>>>     stdout, stderr = streams
>>>     sys.stderr.write("test")
>>>     sys.stdout.write("hello")
>>>     assert stdout.getvalue() == "hello"
>>>     assert stderr.getvalue() == "test"
```

```
>>> stdout.getvalue()
'hello'
```

```
>>> stderr.getvalue()
'test'
```

`vistir.show_cursor(stream=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='UTF-8'>)`

Show the console cursor on the given stream

**Parameters** `stream` – The name of the stream to get the handle for

**Returns** None

**Return type** None

`vistir.hide_cursor(stream=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='UTF-8'>)`

Hide the console cursor on the given stream

**Parameters** `stream` – The name of the stream to get the handle for

**Returns** None

**Return type** None

## 2.1 Subpackages

### 2.1.1 vistir.backports package

`vistir.backports.NamedTemporaryFile` (*mode='w+b', buffering=-1, encoding=None, newline=None, suffix=None, prefix=None, dir=None, delete=True, wrapper\_class\_override=None*)

Create and return a temporary file. Arguments: 'prefix', 'suffix', 'dir' – as for `mkstemp`. 'mode' – the mode argument to `io.open` (default "w+b"). 'buffering' – the buffer size argument to `io.open` (default -1). 'encoding' – the encoding argument to `io.open` (default None) 'newline' – the newline argument to `io.open` (default None) 'delete' – whether the file is deleted on close (default True). The file is created as `mkstemp()` would do it. Returns an object with a file-like interface; the name of the file is accessible as its 'name' attribute. The file will be automatically deleted when it is closed unless the 'delete' argument is set to False.

**class** `vistir.backports.partialmethod` (*func, \*args, \*\*keywords*)

Bases: `object`

Method descriptor with partial application of the given arguments and keywords. Supports wrapping existing descriptors and handles non-descriptor callables as instance methods.

`vistir.backports.register_surrogateescape` ()

Registers the surrogateescape error handler on Python 2 (only)

#### 2.1.1.1 Submodules

##### `vistir.backports.functools` module

**class** `vistir.backports.functools.partialmethod` (*func, \*args, \*\*keywords*)

Bases: `object`

Method descriptor with partial application of the given arguments and keywords. Supports wrapping existing descriptors and handles non-descriptor callables as instance methods.

##### `vistir.backports.tempfile` module

**class** `vistir.backports.tempfile.finalize` (*obj, func, \*args, \*\*kwargs*)

Bases: `object`

Class for finalization of weakrefable objects

`finalize(obj, func, *args, **kwargs)` returns a callable finalizer object which will be called when `obj` is garbage collected. The first time the finalizer is called it evaluates `func(*arg, **kwargs)` and returns the result. After this the finalizer is dead, and calling it just returns None.

When the program exits any remaining finalizers for which the `atexit` attribute is true will be run in reverse order of creation. By default `atexit` is true.

**alive**

Whether finalizer is alive

**atexit**

Whether finalizer should be called at exit

**detach** ()

If alive then mark as dead and return (`obj, func, args, kwargs`); otherwise return None

**peek()**

If alive then return (obj, func, args, kwargs); otherwise return None

`vistir.backports.tempfile.NamedTemporaryFile` (*mode='w+b', buffering=-1, encoding=None, newline=None, suffix=None, prefix=None, dir=None, delete=True, wrapper\_class\_override=None*)

Create and return a temporary file. Arguments: 'prefix', 'suffix', 'dir' – as for mkstemp. 'mode' – the mode argument to io.open (default "w+b"). 'buffering' – the buffer size argument to io.open (default -1). 'encoding' – the encoding argument to io.open (default None) 'newline' – the newline argument to io.open (default None) 'delete' – whether the file is deleted on close (default True). The file is created as mkstemp() would do it. Returns an object with a file-like interface; the name of the file is accessible as its 'name' attribute. The file will be automatically deleted when it is closed unless the 'delete' argument is set to False.

## 2.2 Submodules

### 2.2.1 vistir.cmdparse module

**exception** `vistir.cmdparse.ScriptEmptyError`

Bases: `ValueError`

**class** `vistir.cmdparse.Script` (*command, args=None*)

Bases: `object`

Parse a script line (in Pipfile's [scripts] section).

This always works in POSIX mode, even on Windows.

**args**

**cmdify()**

Encode into a cmd-executable string.

This re-implements `CreateProcess`'s quoting logic to turn a list of arguments into one single string for the shell to interpret.

- All double quotes are escaped with a backslash.
- Existing backslashes before a quote are doubled, so they are all escaped properly.
- Backslashes elsewhere are left as-is; cmd will interpret them literally.

The result is then quoted into a pair of double quotes to be grouped.

An argument is intentionally not quoted if it does not contain whitespaces. This is done to be compatible with Windows built-in commands that don't work well with quotes, e.g. everything with *echo*, and DOS-style (forward slash) switches.

The intended use of this function is to pre-process an argument list before passing it into `subprocess.Popen(..., shell=True)`.

See also: <https://docs.python.org/3/library/subprocess.html#converting-argument-sequence>

**command**

**extend** (*extra\_args*)

**classmethod parse** (*value*)

## 2.2.2 vistir.compat module

**class** `vistir.compat.Path`

Bases: `pathlib.PurePath`

PurePath subclass that can make system calls.

Path represents a filesystem path but unlike PurePath, also offers methods to do system calls on path objects. Depending on your system, instantiating a Path will return either a PosixPath or a WindowsPath object. You can also instantiate a PosixPath or WindowsPath directly, but cannot instantiate a WindowsPath on a POSIX system or vice versa.

**absolute** ()

Return an absolute version of this path. This function works even if the path doesn't point to anything.

No normalization is done, i.e. all '.' and '..' will be kept along. Use resolve() to get the canonical path to a file.

**chmod** (*mode*)

Change the permissions of the path, like os.chmod().

**classmethod** **cwd** ()

Return a new path pointing to the current working directory (as returned by os.getcwd()).

**exists** ()

Whether this path exists.

**expanduser** ()

Return a new path with expanded ~ and ~user constructs (as returned by os.path.expanduser)

**glob** (*pattern*)

Iterate over this subtree and yield all existing files (of any kind, including directories) matching the given relative pattern.

**group** ()

Return the group name of the file gid.

**classmethod** **home** ()

Return a new path pointing to the user's home directory (as returned by os.path.expanduser('~')).

**is\_block\_device** ()

Whether this path is a block device.

**is\_char\_device** ()

Whether this path is a character device.

**is\_dir** ()

Whether this path is a directory.

**is\_fifo** ()

Whether this path is a FIFO.

**is\_file** ()

Whether this path is a regular file (also True for symlinks pointing to regular files).

**is\_mount** ()

Check if this path is a POSIX mount point

**is\_socket** ()

Whether this path is a socket.

**is\_symlink** ()

Whether this path is a symbolic link.

**iterdir** ()

Iterate over the files in this directory. Does not yield any result for the special paths '.' and '..'.

**lchmod** (*mode*)

Like chmod(), except if the path points to a symlink, the symlink's permissions are changed, rather than its target's.

**lstat** ()

Like stat(), except if the path points to a symlink, the symlink's status information is returned, rather than its target's.

**makedirs** (*mode=511, parents=False, exist\_ok=False*)

Create a new directory at this given path.

**open** (*mode='r', buffering=-1, encoding=None, errors=None, newline=None*)

Open the file pointed by this path and return a file object, as the built-in open() function does.

**owner** ()

Return the login name of the file owner.

**read\_bytes** ()

Open the file in bytes mode, read it, and close the file.

**read\_text** (*encoding=None, errors=None*)

Open the file in text mode, read it, and close the file.

**rename** (*target*)

Rename this path to the given path.

**replace** (*target*)

Rename this path to the given path, clobbering the existing destination if it exists.

**resolve** (*strict=False*)

Make the path absolute, resolving all symlinks on the way and also normalizing it (for example turning slashes into backslashes under Windows).

**rglob** (*pattern*)

Recursively yield all existing files (of any kind, including directories) matching the given relative pattern, anywhere in this subtree.

**rmdir** ()

Remove this directory. The directory must be empty.

**samefile** (*other\_path*)

Return whether other\_path is the same or not as this file (as returned by os.path.samefile()).

**stat** ()

Return the result of the stat() system call on this path, like os.stat() does.

**symlink\_to** (*target, target\_is\_directory=False*)

Make this path a symlink pointing to the given path. Note the order of arguments (self, target) is the reverse of os.symlink's.

**touch** (*mode=438, exist\_ok=True*)

Create this file with the given access mode, if it doesn't exist.

**unlink** ()

Remove this file or link. If the path is a directory, use rmdir() instead.

**write\_bytes** (*data*)

Open the file in bytes mode, write to it, and close the file.

**write\_text** (*data, encoding=None, errors=None*)

Open the file in text mode, write to it, and close the file.

`vistir.compat.get_terminal_size` (*fallback=(80, 24)*)

Get the size of the terminal window.

For each of the two dimensions, the environment variable, COLUMNS and LINES respectively, is checked. If the variable is defined and the value is a positive integer, it is used.

When COLUMNS or LINES is not defined, which is the common case, the terminal connected to `sys.__stdout__` is queried by invoking `os.get_terminal_size`.

If the terminal size cannot be successfully queried, either because the system doesn't support querying, or because we are not connected to a terminal, the value given in `fallback` parameter is used. `Fallback` defaults to (80, 24) which is the default size used by many terminal emulators.

The value returned is a named tuple of type `os.terminal_size`.

**class** `vistir.compat.finalize` (*obj, func, \*args, \*\*kwargs*)

Bases: `object`

Class for finalization of weakrefable objects

`finalize(obj, func, *args, **kwargs)` returns a callable finalizer object which will be called when `obj` is garbage collected. The first time the finalizer is called it evaluates `func(*arg, **kwargs)` and returns the result. After this the finalizer is dead, and calling it just returns `None`.

When the program exits any remaining finalizers for which the `atexit` attribute is `true` will be run in reverse order of creation. By default `atexit` is `true`.

**alive**

Whether finalizer is alive

**atexit**

Whether finalizer should be called at exit

**detach** ()

If alive then mark as dead and return (`obj, func, args, kwargs`); otherwise return `None`

**peek** ()

If alive then return (`obj, func, args, kwargs`); otherwise return `None`

**class** `vistir.compat.partialmethod` (*func, \*args, \*\*keywords*)

Bases: `object`

Method descriptor with partial application of the given arguments and keywords.

Supports wrapping existing descriptors and handles non-descriptor callables as instance methods.

**exception** `vistir.compat.JSONDecodeError` (*msg, doc, pos*)

Bases: `ValueError`

Subclass of `ValueError` with the following additional properties:

`msg`: The unformatted error message `doc`: The JSON document being parsed `pos`: The start index of `doc` where parsing failed `lineno`: The line corresponding to `pos` `colno`: The column corresponding to `pos`

**exception** `vistir.compat.FileNotFoundError`

Bases: `OSError`

File not found.

**exception** `vistir.compat.ResourceWarning`

Bases: `Warning`

Base class for warnings about resource usage.

**exception** `vistir.compat.PermissionError`

Bases: `OSError`

Not enough permissions.

`vistir.compat.is_type_checking()`

**exception** `vistir.compat.IsADirectoryError`

Bases: `OSError`

Operation doesn't work on directories.

`vistir.compat.fs_str(string)`

Encodes a string into the proper filesystem encoding.

Borrowed from pip-tools

`vistir.compat.lru_cache(maxsize=128, typed=False)`

Least-recently-used cache decorator.

If *maxsize* is set to None, the LRU features are disabled and the cache can grow without bound.

If *typed* is True, arguments of different types will be cached separately. For example, `f(3.0)` and `f(3)` will be treated as distinct calls with distinct results.

Arguments to the cached function must be hashable.

View the cache statistics named tuple (hits, misses, maxsize, currsiz) with `f.cache_info()`. Clear the cache and statistics with `f.cache_clear()`. Access the underlying function with `f.__wrapped__`.

See: [http://en.wikipedia.org/wiki/Cache\\_algorithms#Least\\_Recently\\_Used](http://en.wikipedia.org/wiki/Cache_algorithms#Least_Recently_Used)

**class** `vistir.compat.TemporaryDirectory(suffix="", prefix=None, dir=None)`

Bases: `object`

Create and return a temporary directory. This has the same behavior as `mkdtemp` but can be used as a context manager. For example:

```
with TemporaryDirectory() as tmpdir: ...
```

Upon exiting the context, the directory and everything contained in it are removed.

`cleanup()`

`vistir.compat.NamedTemporaryFile(mode='w+b', buffering=-1, encoding=None, newline=None, suffix=None, prefix=None, dir=None, delete=True)`

Create and return a temporary file. Arguments: 'prefix', 'suffix', 'dir' – as for `mkstemp`. 'mode' – the mode argument to `io.open` (default "w+b"). 'buffering' – the buffer size argument to `io.open` (default -1). 'encoding' – the encoding argument to `io.open` (default None) 'newline' – the newline argument to `io.open` (default None) 'delete' – whether the file is deleted on close (default True). The file is created as `mkstemp()` would do it.

Returns an object with a file-like interface; the name of the file is accessible as its 'name' attribute. The file will be automatically deleted when it is closed unless the 'delete' argument is set to False.

`vistir.compat.to_native_string(string)`

`vistir.compat.samefile(f1, f2)`

Test whether two pathnames reference the same actual file

**class** `vistir.compat.Mapping`

Bases: `collections.abc.Collection`

`get(k[, d])` → `D[k]` if `k` in `D`, else `d`. `d` defaults to None.

`items()` → a set-like object providing a view on `D`'s items

**keys** () → a set-like object providing a view on D's keys

**values** () → an object providing a view on D's values

**class** `vistir.compat.Hashable`

Bases: `object`

**class** `vistir.compat.MutableMapping`

Bases: `collections.abc.Mapping`

**clear** () → None. Remove all items from D.

**pop** ( $k$ ,  $d$ ) →  $v$ , remove specified key and return the corresponding value.  
If key is not found,  $d$  is returned if given, otherwise `KeyError` is raised.

**popitem** () → ( $k$ ,  $v$ ), remove and return some (key, value) pair  
as a 2-tuple; but raise `KeyError` if D is empty.

**setdefault** ( $k$ ,  $d$ ) →  $D.get(k,d)$ , also set  $D[k]=d$  if  $k$  not in D

**update** ( $E$ ,  $**F$ ) → None. Update D from mapping/iterable E and F.

If E present and has a `.keys()` method, does: for  $k$  in E:  $D[k] = E[k]$  If E present and lacks `.keys()` method,  
does: for ( $k$ ,  $v$ ) in E:  $D[k] = v$  In either case, this is followed by: for  $k$ ,  $v$  in  $F.items()$ :  $D[k] = v$

**class** `vistir.compat.Container`

Bases: `object`

**class** `vistir.compat.Iterator`

Bases: `collections.abc.Iterable`

**class** `vistir.compat.KeysView(mapping)`

Bases: `collections.abc.MappingView`, `collections.abc.Set`

**class** `vistir.compat.ItemsView(mapping)`

Bases: `collections.abc.MappingView`, `collections.abc.Set`

**class** `vistir.compat.MappingView(mapping)`

Bases: `collections.abc.Sized`

**class** `vistir.compat.Iterable`

Bases: `object`

**class** `vistir.compat.Set`

Bases: `collections.abc.Collection`

A set is a finite, iterable container.

This class provides concrete generic implementations of all methods except for `__contains__`, `__iter__` and `__len__`.

To override the comparisons (presumably for speed, as the semantics are fixed), redefine `__le__` and `__ge__`, then the other operations will automatically follow suit.

**isdisjoint** (*other*)

Return True if two sets have a null intersection.

**class** `vistir.compat.Sequence`

Bases: `collections.abc.Reversible`, `collections.abc.Collection`

All the operations on a read-only sequence.

Concrete subclasses must override `__new__` or `__init__`, `__getitem__`, and `__len__`.

**count** (*value*) → integer – return number of occurrences of value

**index** (*value* [, *start* [, *stop* ]]) → integer – return first index of value.  
Raises `ValueError` if the value is not present.

Supporting start and stop arguments is optional, but recommended.

**class** `vistir.compat.Sized`

Bases: `object`

**class** `vistir.compat.ValuesView` (*mapping*)

Bases: `collections.abc.MappingView`, `collections.abc.Collection`

**class** `vistir.compat.MutableSet`

Bases: `collections.abc.Set`

A mutable set is a finite, iterable container.

This class provides concrete generic implementations of all methods except for `__contains__`, `__iter__`, `__len__`, `add()`, and `discard()`.

To override the comparisons (presumably for speed, as the semantics are fixed), all you have to do is redefine `__le__` and then the other operations will automatically follow suit.

**add** (*value*)

Add an element.

**clear** ()

This is slow (creates N new iterators!) but effective.

**discard** (*value*)

Remove an element. Do not raise an exception if absent.

**pop** ()

Return the popped value. Raise `KeyError` if empty.

**remove** (*value*)

Remove an element. If not a member, raise a `KeyError`.

**class** `vistir.compat.MutableSequence`

Bases: `collections.abc.Sequence`

**append** (*value*)

`S.append(value)` – append value to the end of the sequence

**clear** () → None – remove all items from S

**extend** (*values*)

`S.extend(iterable)` – extend sequence by appending elements from the iterable

**insert** (*index*, *value*)

`S.insert(index, value)` – insert value before index

**pop** ([*index*]) → item – remove and return item at index (default last).

Raise `IndexError` if list is empty or index is out of range.

**remove** (*value*)

`S.remove(value)` – remove first occurrence of value. Raise `ValueError` if the value is not present.

**reverse** ()

`S.reverse()` – reverse *IN PLACE*

**class** `vistir.compat.Callable`

Bases: `object`

`vistir.compat.fs_encode` (*path*)

Encode a filesystem path to the proper filesystem encoding.

**Parameters** `bytes]` `path` (`Union[str,)` – A string-like path

**Returns** A bytes-encoded filesystem path representation

`vistir.compat.fs_decode` (`path`)

Decode a filesystem path using the proper filesystem encoding.

**Parameters** `path` – The filesystem path to decode from bytes or string

**Returns** The filesystem path, decoded with the determined encoding

**Return type** `Text`

## 2.2.3 vistir.contextmanagers module

`vistir.contextmanagers.temp_environ` ()

Allow the ability to set `os.environ` temporarily

`vistir.contextmanagers.temp_path` ()

A context manager which allows the ability to set `sys.path` temporarily

```
>>> path_from_virtualenv = load_path("/path/to/venv/bin/python")
>>> print(sys.path)
[
  '/home/user/.pyenv/versions/3.7.0/bin',
  '/home/user/.pyenv/versions/3.7.0/lib/python37.zip',
  '/home/user/.pyenv/versions/3.7.0/lib/python3.7',
  '/home/user/.pyenv/versions/3.7.0/lib/python3.7/lib-dynload',
  '/home/user/.pyenv/versions/3.7.0/lib/python3.7/site-packages'
]
>>> with temp_path():
    sys.path = path_from_virtualenv
    # Running in the context of the path above
    run(["pip", "install", "stuff"])
>>> print(sys.path)
[
  '/home/user/.pyenv/versions/3.7.0/bin',
  '/home/user/.pyenv/versions/3.7.0/lib/python37.zip',
  '/home/user/.pyenv/versions/3.7.0/lib/python3.7',
  '/home/user/.pyenv/versions/3.7.0/lib/python3.7/lib-dynload',
  '/home/user/.pyenv/versions/3.7.0/lib/python3.7/site-packages'
]
```

`vistir.contextmanagers.cd` (`path`)

Context manager to temporarily change working directories

**Parameters** `path` (`str`) – The directory to move into

```
>>> print(os.path.abspath(os.curdir))
'/home/user/code/myrepo'
>>> with cd("/home/user/code/otherdir/subdir"):
...     print("Changed directory: %s" % os.path.abspath(os.curdir))
Changed directory: /home/user/code/otherdir/subdir
>>> print(os.path.abspath(os.curdir))
'/home/user/code/myrepo'
```

`vistir.contextmanagers.atomic_open_for_write` (`target`, `binary=False`, `newline=None`, `encoding=None`)

Atomically open `target` for writing.

This is based on Lektor's `atomic_open()` utility, but simplified a lot to handle only writing, and skip many multi-process/thread edge cases handled by Werkzeug.

### Parameters

- **target** (*str*) – Target filename to write
- **binary** (*bool*) – Whether to open in binary mode, default False
- **newline** (*Optional[str]*) – The newline character to use when writing, determined from system if not supplied.
- **encoding** (*Optional[str]*) – The encoding to use when writing, defaults to system encoding.

How this works:

- Create a temp file (in the same directory of the actual target), and yield for surrounding code to write to it.
- If some thing goes wrong, try to remove the temp file. The actual target is not touched whatsoever.
- If everything goes well, close the temp file, and replace the actual target with this new file.

```
>>> fn = "test_file.txt"
>>> def read_test_file(filename=fn):
    with open(filename, 'r') as fh:
        print(fh.read().strip())

>>> with open(fn, "w") as fh:
    fh.write("this is some test text")
>>> read_test_file()
this is some test text

>>> def raise_exception_while_writing(filename):
    with open(filename, "w") as fh:
        fh.write("writing some new text")
        raise RuntimeError("Uh oh, hope your file didn't get overwritten")

>>> raise_exception_while_writing(fn)
Traceback (most recent call last):
...
RuntimeError: Uh oh, hope your file didn't get overwritten
>>> read_test_file()
writing some new text

# Now try with vistir
>>> def raise_exception_while_writing(filename):
    with vistir.contextmanagers.atomic_open_for_write(filename) as fh:
        fh.write("Overwriting all the text from before with even newer text")
        raise RuntimeError("But did it get overwritten now?")

>>> raise_exception_while_writing(fn)
Traceback (most recent call last):
...
RuntimeError: But did it get overwritten now?

>>> read_test_file()
writing some new text
```

`vistir.contextmanagers.open_file` (*link, session=None, stream=True*)  
Open local or remote file for reading.

**Parameters**

- **link** (*pip.\_internal.index.Link*) – A link object from resolving dependencies with pip, or else a URL.
- **session** (*Optional[Session]*) – A *Session* instance
- **stream** (*bool*) – Whether to stream the content if remote, default True

**Raises** **ValueError** – If link points to a local directory.

**Returns** a context manager to the opened file-like object

`vistir.contextmanagers.spinner` (*spinner\_name=None, start\_text=None, handler\_map=None, nospin=False, write\_to\_stdout=True*)

Get a spinner object or a dummy spinner to wrap a context.

**Parameters**

- **spinner\_name** (*str*) – A spinner type e.g. “dots” or “bouncingBar” (default: {“bouncingBar”})
- **start\_text** (*str*) – Text to start off the spinner with (default: {None})
- **handler\_map** (*dict*) – Handler map for signals to be handled gracefully (default: {None})
- **nospin** (*bool*) – If true, use the dummy spinner (default: {False})
- **write\_to\_stdout** (*bool*) – Writes to stdout if true, otherwise writes to stderr (default: True)

**Returns** A spinner object which can be manipulated while alive

**Return type** `VistirSpinner`

**Raises:** `RuntimeError` – Raised if the spinner extra is not installed

`vistir.contextmanagers.dummy_spinner` (*spin\_type, text, \*\*kwargs*)

`vistir.contextmanagers.replaced_stream` (*stream\_name*)

Context manager to temporarily swap out *stream\_name* with a stream wrapper.

**Parameters** **stream\_name** (*str*) – The name of a sys stream to wrap

**Returns** A `StreamWrapper` replacement, temporarily

```
>>> orig_stdout = sys.stdout
>>> with replaced_stream("stdout") as stdout:
...     sys.stdout.write("hello")
...     assert stdout.getvalue() == "hello"
```

```
>>> sys.stdout.write("hello")
'hello'
```

`vistir.contextmanagers.replaced_streams` ()

Context manager to replace both `sys.stdout` and `sys.stderr` using `replaced_stream`

returns: (*stdout, stderr*)

```
>>> import sys
>>> with vistir.contextmanagers.replaced_streams() as streams:
>>>     stdout, stderr = streams
```

(continues on next page)

(continued from previous page)

```
>>> sys.stderr.write("test")
>>> sys.stdout.write("hello")
>>> assert stdout.getvalue() == "hello"
>>> assert stderr.getvalue() == "test"
```

```
>>> stdout.getvalue()
'hello'
```

```
>>> stderr.getvalue()
'test'
```

## 2.2.4 vistir.misc module

`vistir.misc.shell_escape(cmd)`

Escape strings for use in `Popen()` and `run()`.

This is a passthrough method for instantiating a `Script` object which can be used to escape commands to output as a single string.

`vistir.misc.unnest(elem)`

Flatten an arbitrarily nested iterable.

**Parameters** `elem` (Iterable) – An iterable to flatten

```
>>> nested_iterable = (
    1234, (3456, 4398345, (234234)), (
        2396, (
            23895750, 9283798, 29384, (
                289375983275, 293759, 2347, (
                    2098, 7987, 27599
                )
            )
        )
    )
)
>>> list(vistir.misc.unnest(nested_iterable))
[1234, 3456, 4398345, 234234, 2396, 23895750, 9283798, 29384, 289375983275,
↪293759,
2347, 2098, 7987, 27599]
```

`vistir.misc.dedup(iterable)`

Deduplicate an iterable object like `iter(set(iterable))` but order- preserved.

`vistir.misc.run(cmd, env=None, return_object=False, block=True, cwd=None, verbose=False, nospin=False, spinner_name=None, combine_stderr=True, display_limit=200, write_to_stdout=True)`

Use `subprocess.Popen` to get the output of a command and decode it.

**Parameters**

- `cmd` (`list`) – A list representing the command you want to run.
- `env` (`dict`) – Additional environment settings to pass through to the subprocess.
- `return_object` (`bool`) – When `True`, returns the whole subprocess instance
- `block` (`bool`) – When `False`, returns a potentially still-running `subprocess.Popen` instance

- **cwd** (*str*) – Current working directory context to use for spawning the subprocess.
- **verbose** (*bool*) – Whether to print stdout in real time when non-blocking.
- **nospin** (*bool*) – Whether to disable the cli spinner.
- **spinner\_name** (*str*) – The name of the spinner to use if enabled, defaults to bouncing-Bar
- **combine\_stderr** (*bool*) – Optionally merge stdout and stderr in the subprocess, false if nonblocking.
- **dispay\_limit** (*int*) – The max width of output lines to display when using a spinner.
- **write\_to\_stdout** (*bool*) – Whether to write to stdout when using a spinner, defaults to True.

**Returns** A 2-tuple of (output, error) or a `subprocess.Popen` object.

**Warning:** Merging standard out and standarad error in a nonblocking subprocess can cause errors in some cases and may not be ideal. Consider disabling this functionality.

`vistir.misc.load_path` (*python*)

Load the `sys.path` from the given python executable's environment as json.

**Parameters** `python` (*str*) – Path to a valid python executable

**Returns** A python representation of the `sys.path` value of the given python executable.

**Return type** `list`

```
>>> load_path("/home/user/.virtualenvs/requirementslib-5MhGuG3C/bin/python")
['', '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python37.zip',
 '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python3.7',
 '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python3.7/lib-dynload',
 '/home/user/.pyenv/versions/3.7.0/lib/python3.7',
 '/home/user/.virtualenvs/requirementslib-5MhGuG3C/lib/python3.7/site-packages',
 '/home/user/git/requirementslib/src']
```

`vistir.misc.partialclass` (*cls, \*args, \*\*kwargs*)

Returns a partially instantiated class.

**Returns** A partial class instance

**Return type** `cls`

```
>>> source = partialclass(Source, url="https://pypi.org/simple")
>>> source
<class '__main__.Source'>
>>> source(name="pypi")
>>> source.__dict__
mappingproxy({
  '__module__': '__main__',
  '__dict__': <attribute '__dict__' of 'Source' objects>,
  '__weakref__': <attribute '__weakref__' of 'Source' objects>,
  '__doc__': None,
  '__init__': functools.partialmethod(
    <function Source.__init__ at 0x7f23af429bf8>, , url='https://pypi.org/
↪simple'
  )
})
```

(continues on next page)

(continued from previous page)

```

})
>>> new_source = source(name="pypi")
>>> new_source
<__main__.Source object at 0x7f23af189b38>
>>> new_source.__dict__
{'url': 'https://pypi.org/simple', 'verify_ssl': True, 'name': 'pypi'}

```

`vistir.misc.to_text` (*string*, *encoding='utf-8'*, *errors=None*)

Force a value to a text-type.

#### Parameters

- **string** (*str* or *bytes unicode*) – Some input that can be converted to a unicode representation.
- **encoding** – The encoding to use for conversions, defaults to “utf-8”
- **encoding** – str, optional

**Returns** The unicode representation of the string

**Return type** `str`

`vistir.misc.to_bytes` (*string*, *encoding='utf-8'*, *errors=None*)

Force a value to bytes.

#### Parameters

- **string** (*str* or *bytes unicode* or *a memoryview subclass*) – Some input that can be converted to a bytes.
- **encoding** – The encoding to use for conversions, defaults to “utf-8”
- **encoding** – str, optional

**Returns** Corresponding byte representation (for use in filesystem operations)

**Return type** `bytes`

`vistir.misc.chunked` (*n*, *iterable*)

Split an iterable into lists of length *n*.

#### Parameters

- **n** (*int*) – Number of unique groups
- **iterable** (*iter*) – An iterable to split up

from [https://github.com/erikrose/more-itertools/blob/master/more\\_itertools/more.py](https://github.com/erikrose/more-itertools/blob/master/more_itertools/more.py)

`vistir.misc.take` (*n*, *iterable*)

Take *n* elements from the supplied iterable without consuming it.

#### Parameters

- **n** (*int*) – Number of unique groups
- **iterable** (*iter*) – An iterable to split up

from [https://github.com/erikrose/more-itertools/blob/master/more\\_itertools/recipes.py](https://github.com/erikrose/more-itertools/blob/master/more_itertools/recipes.py)

`vistir.misc.divide` (*n*, *iterable*)

split an iterable into *n* groups, per <https://more-itertools.readthedocs.io/en/latest/api.html#grouping>.

#### Parameters

- **n** (*int*) – Number of unique groups
- **iterable** (*iter*) – An iterable to split up

**Returns** a list of new iterables derived from the original iterable

**Return type** *list*

`vistir.misc.getpreferredencoding()`

Determine the proper output encoding for terminal rendering.

`vistir.misc.decode_for_output(output, target_stream=None, translation_map=None)`

Given a string, decode it for output to a terminal.

**Parameters**

- **output** (*str*) – A string to print to a terminal
- **target\_stream** – A stream to write to, we will encode to target this stream if possible.
- **translation\_map** (*dict*) – A mapping of unicode character ordinals to replacement strings.

**Returns** A re-encoded string using the preferred encoding

**Return type** *str*

`vistir.misc.get_canonical_encoding_name(name)`

Given an encoding name, get the canonical name from a codec lookup.

**Parameters** **name** (*str*) – The name of the codec to lookup

**Returns** The canonical version of the codec name

**Return type** *str*

`vistir.misc.get_wrapped_stream(stream, encoding=None, errors='replace')`

Given a stream, wrap it in a *StreamWrapper* instance and return the wrapped stream.

**Parameters**

- **stream** – A stream instance to wrap
- **encoding** (*str*) – The encoding to use for the stream
- **errors** (*str*) – The error handler to use, default “replace”

**Returns** A new, wrapped stream

**Return type** *StreamWrapper*

**class** `vistir.misc.StreamWrapper` (*stream, encoding, errors, line\_buffering=True, \*\*kwargs*)

Bases: `_io.TextIOWrapper`

This wrapper class will wrap a provided stream and supply an interface for compatibility.

**isatty** ()

Return whether this is an ‘interactive’ stream.

Return False if it can’t be determined.

**write** (*x*)

Write string to stream. Returns the number of characters written (which is always equal to the length of the string).

**writelines** (*lines*)

## 2.2.5 vistir.path module

`vistir.path.check_for_unc_path(path)`

Checks to see if a pathlib *Path* object is a unc path or not.

`vistir.path.get_converted_relative_path(path, relative_to=None)`

Convert *path* to be relative.

Given a vague relative path, return the path relative to the given location.

### Parameters

- **path** (*str*) – The location of a target path
- **relative\_to** (*str*) – The starting path to build against, optional

**Returns** A relative posix-style path with a leading `./`

This performs additional conversion to ensure the result is of POSIX form, and starts with `./`, or is precisely `..`

```
>>> os.chdir('/home/user/code/myrepo/myfolder')
>>> vistir.path.get_converted_relative_path('/home/user/code/file.zip')
'../../file.zip'
>>> vistir.path.get_converted_relative_path('/home/user/code/myrepo/myfolder/
↪mysubfolder')
'./mysubfolder'
>>> vistir.path.get_converted_relative_path('/home/user/code/myrepo/myfolder')
'.'
```

`vistir.path.handle_remove_readonly(func, path, exc)`

Error handler for `shutil.rmtree`.

Windows source repo folders are read-only by default, so this error handler attempts to set them as writeable and then proceed with deletion.

### Parameters

- **func** (*function*) – The caller function
- **path** (*str*) – The target path for removal
- **exc** (*Exception*) – The raised exception

This function will call `check_is_readonly_path()` before attempting to call `set_write_bit()` on the target path and try again.

`vistir.path.normalize_path(path)`

Return a case-normalized absolute variable-expanded path.

**Parameters** **path** (*str*) – The non-normalized path

**Returns** A normalized, expanded, case-normalized path

**Return type** *str*

`vistir.path.is_in_path(path, parent)`

Determine if the provided full path is in the given parent root.

### Parameters

- **path** (*str*) – The full path to check the location of.
- **parent** (*str*) – The parent path to check for membership in

**Returns** Whether the full path is a member of the provided parent.

**Return type** `bool``vistir.path.is_file_url(url)`

Returns true if the given url is a file url.

`vistir.path.is_readonly_path(fn)`

Check if a provided path exists and is readonly.

Permissions check is `bool(path.stat & stat.S_IREAD)` or `not os.access(path, os.W_OK)``vistir.path.is_valid_url(url)`

Checks if a given string is an url.

`vistir.path.mkdir_p(newdir, mode=511)`

Recursively creates the target directory and all of its parents if they do not already exist. Fails silently if they do.

**Parameters** `newdir` (`str`) – The directory path to ensure**Raises** `OSError` if a file is encountered along the way`vistir.path.ensure_mkdir_p(mode=511)`Decorator to ensure `mkdir_p` is called to the function's return value.`vistir.path.create_tracked_tempdir(*args, **kwargs)`

Create a tracked temporary directory.

This uses `TemporaryDirectory`, but does not remove the directory when the return value goes out of scope, instead registers a handler to cleanup on program exit.

The return value is the path to the created directory.

`vistir.path.create_tracked_tempfile(*args, **kwargs)`

Create a tracked temporary file.

This uses the `NamedTemporaryFile` construct, but does not remove the file until the interpreter exits.

The return value is the file object.

`vistir.path.path_to_url(path)`

Convert the supplied local path to a file uri.

**Parameters** `path` (`str`) – A string pointing to or representing a local path**Returns** A `file://` uri for the same location**Return type** `str`

```
>>> path_to_url("/home/user/code/myrepo/myfile.zip")
'file:///home/user/code/myrepo/myfile.zip'
```

`vistir.path.rmtree(directory, ignore_errors=False, onerror=None)`Stand-in for `rmtree()` with additional error-handling.This version of `rmtree` handles read-only paths, especially in the case of index files written by certain source control systems.**Parameters**

- **directory** (`str`) – The target directory to remove
- **ignore\_errors** (`bool`) – Whether to ignore errors, defaults to `False`
- **onerror** (`func`) – An error handling function, defaults to `handle_remove_readonly()`

---

**Note:** Setting `ignore_errors=True` may cause this to silently fail to delete the path

---

`vistir.path.safe_expandvars` (*value*)

Call `os.path.expandvars` if *value* is a string, otherwise do nothing.

`vistir.path.set_write_bit` (*fn*)

Set read-write permissions for the current user on the target path. Fail silently if the path doesn't exist.

**Parameters** `fn` (*str*) – The target filename or path

**Returns** None

`vistir.path.url_to_path` (*url*)

Convert a valid file url to a local filesystem path.

Follows logic taken from pip's equivalent function

`vistir.path.walk_up` (*bottom*)

Mimic `os.walk`, but walk 'up' instead of down the directory tree.
